Dear Dr Marshal

**CT BRAIN & X-RAY CHEST AND RIGHT RIBS****Clinical Details:**

? Fracture.

**CT Brain:****Report:**

No intra- or extra-axial haemorrhage, collection or masses identified.

Normal configuration and size of the cerebral sulci and ventricles for patient age.

Grey-white matter differentiation is preserved throughout.

The pituitary fossa, brainstem and posterior fossa are within normal limits.

No calvarial fracture or scalp haematoma identified. Incidental note of a ground-glass expansile lesion with a narrow zone of transition measuring 13 x 10mm of the supraorbital left frontal bone, which is unchanged since previous CT 29/02/2024, and most likely reflective of focal fibrous dysplasia.

**CONCLUSION:**

No acute intracranial pathology. No calvarial fracture.

Incidental note of a stable 13mm expansile ground-glass narrow zone transition osseous lesion of the left supraorbital frontal bone which is stable since 2024, with the favoured differential being focal fibrous dysplasia.

**X-ray Chest and Right Ribs:****Report:**

The lungs are clear, no airspace opacity, confluent consolidation or lobar collapse. No pneumothorax or pleural effusion.

Normal cardiomedastinal contour. No displaced rib fracture is identified. Normal alignment of the thoracic spine.

MIT: Jasmin Wright / Bikram Karki
